Class 10 Chapter: Application of Trigonometry [Hight and Distance] Solved Problems
Question: A kite is flying with a string of length 200 m . If the thread makes an angle $30^{\circ}$ with the ground, find the distance of the kite from the ground level. (Here, assume that the string is along a straight line)
Golution Let $h$ denote the distance of the kite from the ground level.
In the figure, $A C$ is the string
Given that $\quad \angle C A B=30^{\circ}$ and $A C=200 \mathrm{~m}$
In the right $\triangle C A B, \sin 30^{\circ}=\frac{h}{200}$

$$
\begin{array}{ll} 
& \Longrightarrow \quad h=200 \sin 30^{\circ} \\
\therefore & \\
& h=200 \times \frac{1}{2}=100 \mathrm{~m}
\end{array}
$$

Fig. 7.7

Hence, the distance of the kite from the ground level is 100 m .
Question: Find the angular elevation (angle of elevation from the ground level) of the Sun when he length of the shadow of a 30 m long pole is $10 \sqrt{3} \mathrm{~m}$.

Solution Let $S$ be the position of the Sun and $B C$ be the pole.
Let $A B$ denote the length of the shadow of the pole.
Let the angular elevation of the Sun be $\theta$.
Given that $\quad A B=10 \sqrt{3} \mathrm{~m}$ and

$$
B C=30 \mathrm{~m}
$$

In the right $\triangle C A B, \quad \tan \theta=\frac{B C}{A B}=\frac{30}{10 \sqrt{3}}=\frac{3}{\sqrt{3}}$

$$
\begin{aligned}
\therefore \quad \Rightarrow \quad \tan \theta & =\sqrt{3} \\
\therefore \quad \theta & =60^{\circ}
\end{aligned}
$$

Fig. 7.9

Thus, the angular elevation of the Sun from the ground level is $60^{\circ}$.
Question: The angle of elevation of the top of a tower as seen by an observer is $30^{\circ}$. The observer is at a distance of $30 \sqrt{3} \mathrm{~m}$ from the tower. If the eye level of the observer is 1.5 m above the ground level, then find the height of the tower.

Solution Let $B D$ be the height of the tower and $A E$ be the distance of the eye level of the observer from the ground level.

Draw $E C$ parallel to $A B$ such that $A B=E C$.
Given $A B=E C=30 \sqrt{3} \mathrm{~m}$ and

$$
A E=B C=1.5 \mathrm{~m}
$$

In right angled $\triangle D E C$,

$$
\begin{array}{rlrl}
\tan 30^{\circ} & =\frac{C D}{E C} \\
\Rightarrow \quad C D & =E C \tan 30^{\circ}=\frac{30 \sqrt{3}}{\sqrt{3}} \\
\therefore \quad & C D & =30 \mathrm{~m} \\
\text { tower, } \quad B D & =B C+C D \\
& & =1.5+30=31.5 \mathrm{~m} .
\end{array}
$$

Thus, the height of the tower, $\quad B D=B C+C D$

Question: A vertical tree is broken by the wind. The top of the tree touches the ground and makes an angle 30 with it. If the top of the tree touches the ground 30 m away from its foot, then find the actual height of the tree. Ans: 30V3

Question: A je fighter at an instance when their angles of elevation from the same observation point are $60^{\circ}$ and $45^{\circ}$ respectively. Find the distance of the first jet fighter from the second jet at that instant.

$$
\text { (use } \sqrt{3}=1.732 \text { ) }
$$

Solution:
Let $A$ and $B$ be the positions of the two jet fighters at the given instant when one is directly above the other.

Let $C$ be the point on the ground such that $A C=3000 \mathrm{~m}$.
Given $\angle A O C=60^{\circ}$ and $\angle B O C=45^{\circ}$
Let $h$ denote the distance between the jets at the instant.
In the right angled $\triangle B O C, \quad \tan 45^{\circ}=\frac{B C}{O C}$

$$
\Longrightarrow \quad O C=B C \quad\left(\because \tan 45^{\circ}=1\right)
$$

Thus,

$$
\begin{equation*}
O C=3000-h \tag{1}
\end{equation*}
$$

Fig. 7.12

In the right angled $\triangle A O C, \tan 60^{\circ}=\frac{A C}{O C}$

From (1) and (2), we get $3000-h=1000 \sqrt{3}$

$$
\Longrightarrow \quad h=3000-1000 \times 1.732=1268 \mathrm{~m}
$$

The distance of the first jet fighter from the second jet at that instant is 1268 m .

[^0]Question: The angle of elevation of the top of a hill from the foot of a tower is $60^{\circ}$ and the angle of elevation of the top of the tower from the foot of the hill is $30^{\circ}$. If the tower is 50 m high, then find the height of the hill.

Solution Let $A D$ be the height of tower and $B C$ be the height of the hill.
Given $\angle C A B=60^{\circ}, \angle A B D=30^{\circ}$ and $A D=50 \mathrm{~m}$.
Let $\mathrm{BC}=h$ metres.
Now, in the right angled $\triangle D A B, \tan 30^{\circ}=\frac{A D}{A B}$

$$
\begin{array}{ll}
\Rightarrow & A B=\frac{A D}{\tan 30^{\circ}} \\
\therefore & A B=50 \sqrt{3} \mathrm{~m}
\end{array}
$$

Fig. 7.13
(1)

Also, in the right angled $\triangle C A B, \tan 60^{\circ}=\frac{B C}{A B}$

$$
\Longrightarrow B C=A B \tan 60^{\circ}
$$

Thus, using (1) we get

$$
h=B C=(50 \sqrt{3}) \sqrt{3}=150 \mathrm{~m}
$$

Hence, the height of the hill is 150 m .
Question: A vertical wall and a tower are on the ground. As seen from the top of the tower , th angles of depression of the top and bottom of the wall are $45^{\circ}$ and $60^{\circ}$ respectively. Find th height of the wall if the height of the tower is 90 m . (use $\sqrt{3}=1.732$ )

Solution Let $A E$ denote the wall and $B D$ denote the tower.
Draw $E C$ parallel to $A B$ such that $A B=E C$. Thus, $A E=B C$.
Let $A B=x$ metres and $A E=h$ metres.
Given that $B D=90 \mathrm{~m}$ and $\angle D A B=60^{\circ}, \angle D E C=45^{\circ}$.
Now, $A E=B C=h$ metres
Thus, $C D=B D-B C=90-h$.

Fig. 7.14

In the right angled $\triangle D A B, \tan 60^{\circ}=\frac{B D}{A B}=\frac{90}{x}$

$$
\begin{equation*}
\Longrightarrow \quad x=\frac{90}{\sqrt{3}}=30 \sqrt{3} \tag{1}
\end{equation*}
$$

In the right angled $\triangle D E C, \tan 45^{\circ}=\frac{D C}{E C}=\frac{90-h}{x}$

$$
\begin{equation*}
\text { Thus, } \quad x=90-h \tag{2}
\end{equation*}
$$

From (1) and (2), we have $90-h=30 \sqrt{3}$
Thus, the height of the wall, $\quad h=90-30 \sqrt{3}=38.04 \mathrm{~m}$

Question: A girl standing on a lighthouse built on a cliff near the seashore, observes two boats due East of the lighthouse. The angles of depression of the two boats are $30^{\circ}$ and $60^{\circ}$. The distance between the boats is 300 m . Find the distance of the top of the lighthouse from the sea level.
Solution Let $A$ and $D$ denote the foot of the cliff and the top of the lighthouse respectively. Let $B$ and $C$ denote the two boats.
Let $h$ metres be the distance of the top of the lighthouse from the sea level.
Let $A B=x$ metres.
Given that $\angle A B D=60^{\circ}, \angle A C D=30^{\circ}$
In the right angled $\triangle A B D$,

$$
\begin{aligned}
\tan 60^{\circ} & =\frac{A D}{A B} \\
\Rightarrow \quad A B & =\frac{A D}{\tan 60^{\circ}}
\end{aligned}
$$

Thus,

$$
x=\frac{h}{\sqrt{2}}
$$

Fig. 7.15

Also, in the right angled $\triangle A C D$, we have

$$
\begin{align*}
\tan 30^{\circ} & =\frac{A D}{A C} \\
\Longrightarrow \quad A C & =\frac{A D}{\tan 30^{\circ}} \Longrightarrow x+300=\frac{h}{\left(\frac{1}{\sqrt{3}}\right)} \\
x+300 & =h \sqrt{3} . \tag{2}
\end{align*}
$$

Thus,
Using (1) in (2), we get $\frac{h}{\sqrt{3}}+300=h \sqrt{3}$

$$
\begin{aligned}
\Longrightarrow \quad h \sqrt{3}-\frac{h}{\sqrt{3}} & =300 \\
2 h & =300 \sqrt{3} . \quad \text { Thus, } h=150 \sqrt{3} .
\end{aligned}
$$

Hence, the height of the lighthouse from the sea level is $150 \sqrt{3} \mathrm{~m}$.
Question: A boy spots a balloon moving with the wind in a horizontal line at a height of 88.2 n from the ground level. The distance of his eye level from the ground is 1.2 m . The angle o elevation of the balloon from his eyes at an instant is $60^{\circ}$. After some time, from the sam point of observation, the angle of elevation of the balloon reduces to $30^{\circ}$. Find the distanc covered by the balloon during the interval.
Solution Let $A$ be the point of observation.
Let $E$ and $D$ be the positions of the balloon when its angles of elevation are $60^{\circ}$ and $30^{\circ}$ respectively.
Let $B$ and $C$ be the points on the horizontal line such that $B E=C D$.

## JSUNIL TUTORIAL,SAMASTIPUR <br> By Jsunil

Let $A^{\prime}, B^{\prime}$ and $C^{\prime}$ be the points on the ground such that $A^{\prime} A=B^{\prime} B=C^{\prime} C=1.2 \mathrm{~m}$.
Given that $\angle E A B=60^{\circ}, \angle D A C=30^{\circ}$

$$
B B^{\prime}=C C^{\prime}=1.2 \mathrm{~m} \text { and } C^{\prime} D=88.2 \mathrm{~m} .
$$

Also, we have $\quad B E=C D=87 \mathrm{~m}$.
Now, in the right angled $\triangle E A B$, we have

Thus,

$$
\begin{aligned}
\tan 60^{\circ} & =\frac{B E}{A B} \\
A B & =\frac{87}{\tan 60^{\circ}}=\frac{87}{\sqrt{3}}=29 \sqrt{3}
\end{aligned}
$$

Fig. 7.16

Again in the right angled $\triangle D A C$, we have $\tan 30^{\circ}=\frac{D C}{A C}$
Thus,

$$
A C=\frac{87}{\tan 30^{\circ}}=87 \sqrt{3} .
$$

Therefore, the distance covered by the balloon is

$$
\begin{aligned}
E D=B C & =A C-A B \\
& =87 \sqrt{3}-29 \sqrt{3}=58 \sqrt{3} \mathrm{~m} .
\end{aligned}
$$

Question: A flag post stands on the top of a building. From a point on the ground, the angles of elevation of the top and bottom of the flag post are $60^{\circ}$ and $45^{\circ}$ respectively. If the height of the flag post is 10 m , find the height of the building. (use $\sqrt{3}=1.732$ )

## Solution

Let $A$ be the point of observation and $B$ be the foot of the building.
Let $B C$ denote the height of the building and $C D$ denote height of the flag post.
Given that $\angle C A B=45^{\circ}, \angle D A B=60^{\circ}$ and $C D=10 \mathrm{~m}$
Let $B C=h$ metres and $A B=x$ metres.
Now, in the right angled $\triangle C A B$,

$$
\tan 45^{\circ}=\frac{B C}{A B} .
$$

Thus,

$$
A B=B C \quad \text { i.e., } x=h
$$

Also, in the right angled $\triangle D A B$,

$$
\begin{aligned}
\tan 60^{\circ} & =\frac{B D}{A B} \\
\Longrightarrow \quad A B & =\frac{h+10}{\tan 60^{\circ}} \quad \Longrightarrow x=\frac{h+10}{\sqrt{3}}
\end{aligned}
$$

Fig. 7.17

From (1) and (2), we get $h=\frac{h+10}{\sqrt{3}}$

$$
\begin{aligned}
\Rightarrow \quad \sqrt{3} h-h & =10 \\
\Rightarrow \quad h & =\left(\frac{10}{\sqrt{3}-1}\right)\left(\frac{\sqrt{3}+1}{\sqrt{3}+1}\right)=\frac{10(\sqrt{3}+1)}{3-1} \\
& =5(2.732)=13.66 \mathrm{~m}
\end{aligned}
$$

Hence the heicht of the huildino is 1366 m

Question: A man on the deck of a ship, 14 m above the water level, observes that the angle of elevation of the top of a cliff is $60^{\circ}$ and the angle of depression of the base of the cliff is $30^{\circ}$. Find the height of the cliff.
Solution Let $B D$ be the height of the cliff.
Let $A$ be the position of ship and $E$ be the point of observation so that $A E=14 \mathrm{~m}$.
Draw $E C$ parallel to $A B$ such that $A B=E C$.
Given that $\angle A B E=30^{\circ}, \angle D E C=60^{\circ}$
In the right angled $\triangle A B E, \quad \tan 30^{\circ}=\frac{A E}{A B}$

Fig. 7.18

$$
\therefore \quad A B=\frac{A E}{\tan 30^{\circ}} \Longrightarrow A B=14 \sqrt{3} \text { Thus, } E C=14 \sqrt{3}(\because A B=E C)
$$

In the right angled $\triangle D E C, \quad \tan 60^{\circ}=\frac{C D}{E C}$

$$
\therefore \quad C D=E C \tan 60^{\circ} \Longrightarrow C D=(14 \sqrt{3}) \sqrt{3}=42 \mathrm{~m}
$$

Thus, the height of the cliff, $B D=B C+C D=14+42=56 \mathrm{~m}$.

Question: The angle of elevation of an aeroplane from a point $A$ on the ground is $60^{\circ}$. After a flight of 15 seconds horizontally, the angle of elevation changes to $30^{\circ}$. If the aeroplane is flying at a speed of $200 \mathrm{~m} / \mathrm{s}$, then find the constant height at which the aeroplane is flying.

Solution Let A be the point of observation.

Let $E$ and $D$ be positions of the aeroplane initially and after 15 seconds respectively. Let $B E$ and $C D$ denote the constant height at which the aeroplane is flying.
Given that $\angle D A C=30^{\circ}, \angle E A B=60^{\circ}$.
Let $B E=C D=h$ metres.
Let $A B=x$ metres.
The distance covered in 15 seconds,

Fig. 7.19

$$
E D=200 \times 15=3000 \mathrm{~m} \quad(\text { distance travelled }=\text { speed } \times \text { time })
$$

Thus, $B C=3000 \mathrm{~m}$.
In the right angled $\triangle D A C, \tan 30^{\circ}=\frac{C D}{A C} C D=A C \tan 30^{\circ}$
Thus, $\quad h=(x+3000) \frac{1}{\sqrt{3}}$.
In the right angled $\triangle E A B$,

$$
\begin{equation*}
\tan 60^{\circ}=\frac{B E}{A B} \quad B E=A B \tan 60^{\circ} \Longrightarrow h=\sqrt{3} x \tag{1}
\end{equation*}
$$

From (1) and (2), we have $\sqrt{3} x=\frac{1}{\sqrt{2}}(x+3000) \Rightarrow 3 x=x+3000 \Rightarrow x=1500 \mathrm{~m}$.
Thus, from (2) it follows that $h=1500 \sqrt{3} \mathrm{~m}$.
The constant height at which the aeroplane is flying, is $1500 \sqrt{3} \mathrm{~m}$.

[^0]:    Question: The angle of elevation of the top of a hill from the foot of a tower is 60 and the angle of elevation of the top of the tower from the foot of the hill is $\mathbf{3 0}$. If the tower is 50 m high, then find the height of the hill
