# TUTOBIAL <br> ACBSE Coaching for S(athematics and Science 

Physics _ Archimedes' Principle Class 9(Detail Study)

## A1. Density ( $\rho$ )

The density of a body is defined as mass per unit volume.
i.e. $\quad \rho=\frac{M}{V}$
$\rho \quad=$ density $\left(\mathrm{kgm}^{-3}\right)$
$\mathrm{M} \quad=$ mass of the body (kg)
$\mathrm{V}=$ volume of the body $\left(\mathrm{m}^{3}\right)$
**NOTE:

1. The mass of a body is a constant quantity while the volume varies with temperature (and even with pressure for gas). So the density depends on temperature too. However the variation of density with temperature is generally small enough to be neglected.
2. The density of water at $4^{0} \mathrm{C}$ is $1000 \mathrm{kgm}^{-3}$ or $1 \mathrm{gcm}^{-3}$.

## A. 2 Relative Density (R.D.)

The relative density of a body is defined as the ratio of the density of the body to that of water.
i.e. Relative Density of a body $=\frac{\text { Density of the body }}{\text { Density of water }}$
$\rightarrow$ It can easily be seen that the relative density of a body can be defined alternatively as:
$\mathrm{RD}=\frac{\text { mass of a body }}{\text { mass of equal volume of water }}=\frac{\text { weight of the body }}{\text { weight of equal volume of water }}$
**NOTE: 1. R.D. is only a pure number; it has no unit.
2. R.D. of water is obviously 1 .
3. density of a body = R.D. of the body $\times$ density of water
e.g.Let RD of a body $=5$

So, density of body $=5 \times 1000 \mathrm{kgm}^{-3}=5000 \mathrm{kgm}^{-3}$

## EXAMPLES:

1. Find the mass of air inside a room measuring $10 \mathrm{~m} \times 8 \mathrm{~m} \times 3 \mathrm{~m}$, if the density of air is $1.28 \mathrm{kgm}^{-3}$.
2. A container of volume $0.05 \mathrm{~m}^{3}$ is full of ice. When the ice melts into water, how many kg of water should be added to fill it up? $\left(\right.$ density of ice $=900 \mathrm{kgm}^{-3}$; density of water $=1000 \mathrm{kgm}^{-3}$ )
Mass of ice $=\rho_{\text {ice }} \times 0.05=45 \mathrm{~kg}$
Mass of water $=\rho_{\text {water }} \times 0.05=50 \mathrm{~kg}$
5 kg of water should be added to fill it up

## Theilis

 ACBSE Coaching for O(athematics and Science3. If $1 \mathrm{~m}^{3}$ of water is mixed with $3 \mathrm{~m}^{3}$ of a liquid to form a mixture of density $850 \mathrm{kgm}^{-3}$, find the density of the liquid, assuming that there is no contraction of volume. (Density of water $=1000 \mathrm{kgm}^{-3}$ )
Mass of water $=d \times V=1 \times 1000=1000 \mathrm{~kg} / \mathrm{m}^{3}$
Mass of liquid $=d \times 3=3 \mathrm{~d} \mathrm{~kg} / \mathrm{m}^{3}$
Density of mixture $=850 \mathrm{kgm}^{-3}=\frac{1000+3 d}{1+3}$
$\Rightarrow$ The density of the liquid $\frac{3400-1000}{3}=800 \mathrm{~kg} / \mathrm{m} 3$
4. An alloy consists of $60 \%$ aluminium and $40 \%$ tin by weight.
(Density of aluminium $=2700 \mathrm{kgm}^{-3}$; density of $\mathrm{tin}=7300 \mathrm{kgm}^{-3}$.)
(i) What is the density of the alloy?

$$
\ell=\frac{M}{V_{a}+V_{\ell}}=\frac{M}{\frac{0.6 M}{\ell_{a}}+\frac{0.4 M}{\ell_{t}}}=3610 \mathrm{kgm}^{-3}
$$

(Ans: $3610 \mathrm{kgm}^{-3}$ )
(ii) What is the mass of tin in $0.02 \mathrm{~m}^{3}$ of the alloy?

$$
\begin{aligned}
& \ell=\frac{M}{V} \Rightarrow 3610 \mathrm{kgm}^{-3}=\frac{M}{0.02}=72.2 \mathrm{~kg} \\
& M_{a}=0.6 M=0.6 \times 72.2 \mathrm{~kg}=28.9 \mathrm{~kg}
\end{aligned}
$$

(Ans: $3610 \mathrm{kgm}^{-3}$ )
5. Find the density of 14 K gold if the densities of gold and copper are respectively 19300 and $8900 \mathrm{kgm}^{-3}$.
( 14 K is a mixture of $\frac{10}{24}$ of copper by mass.)

$$
\ell=\frac{M}{V_{g}+V_{c}}=\frac{M}{\frac{14}{24} \frac{M}{19300}+\frac{10}{24} \frac{M}{2900}}=12980 \mathrm{kgm}^{-3}
$$

(Ans: $12980 \mathrm{kgm}^{-3}$ )

## A. 3 : Archimedes' Principle

Introduction

- When an object is lowered into a liquid, it is found to lose weight. It is because the liquid exerts an up thrust on the object.

## Theilis

 ACBSE Coaching for O(athematics and Science
(i) up thrust = apparent lost in weight of the object = W1 -W 2
(ii) Experimentally, $\mathrm{W} 1-\mathrm{W} 2=\mathrm{W} \quad=$ weight of liquid displaced
(ii) Hence, up thrust acting on a body = weight of liquid displaced by the body
(a) Principle

- Archimedes' Principle states that when a body is totally or partially immersed in a fluid, it experiences an up thrust equal to the weight of the fluid displaced.
**NOTE: 1. When a body is totally immersed, it displaced its own volume of fluid.

2. The term fluid covers liquids and gases.
3. The up thrust acts vertically upwards through the centre of gravity of the fluid displaced.

## EXAMPLES: (Take $\mathrm{g}=10 \mathrm{~ms}-2$ whenever necessary.)

1. A block of aluminium has a volume of $0.1 \mathrm{~m}^{3}$ and a density of $2700 \mathrm{kgm}^{-3}$.

## Calculate:

(a) the weight of the aluminum block,

$$
\begin{aligned}
& m=d x v \\
& W=m g=2700 N
\end{aligned}
$$

(b) The apparent weight of the block when immersed in water of density $1000 \mathrm{kgm}^{-3}$.

$$
\text { Apparent weight }=2700-g(1000)(0.1)=1700 \mathrm{~N}
$$

2. A rock of mass 114 kg is lifted from the bottom of a river 10 m deep. Densities of water and rock are 1000 and $5700 \mathrm{kgm}-3$ respectively. Find
(a) the force of buoyancy (i.e. up thrust) on the rock.

$$
\mathrm{U}=\mathrm{w} \mathrm{\ell} . \text { of water displaced }
$$

# JsuJIL THIOBAL ACBSE Coaching for 9(athematics and Science 

$$
=\mathrm{mg}=1000 \times \mathrm{V}_{\mathrm{H} 20 \mathrm{~g}}=1000 \times \mathrm{V}_{\mathrm{rock}} \mathrm{~g}=1000 \times \frac{M_{\text {rock }}}{\ell_{\text {rock }}} g
$$

(b) its apparent weight, $\quad 1140 \mathrm{~N}-200 \mathrm{~N}=940 \mathrm{~N}$
(c)the work done in lifting the rock. $940 \times 10=9400 \mathrm{~J}$
3. A block of load weight 5.5 N in air and 5 N in water. (Density of water $=1000 \mathrm{kgm}^{-3}$ )
(a) Find the volume of water displaced by the load block.

$$
\begin{aligned}
5.5-5 & =\mathrm{mg} \\
& =1000 \mathrm{vg} \\
\mathrm{~V} & =5 \times 10^{-5} \mathrm{~m}^{3}
\end{aligned}
$$

a) Find the volume of the load block.

V of load block $\times$ Volume weight displaced

$$
=5 \times 10^{-5} \mathrm{~m}^{3}
$$

b) What is the density of the load block?

$$
\begin{aligned}
& m=\frac{5.5}{g} \\
& \ell=\frac{m}{V} \\
& =\frac{0.55}{5 \times 10^{-5}}=11000 \mathrm{kgm}^{-3}
\end{aligned}
$$

.4. The following diagrams show that a marble weight 0.3 N in air, 0.2 N in water, 0.22 N in alcohol. (Density of water $=$ $1000 \mathrm{kgm}^{-3}$.)

Find
(a) the up thrust of water on the marble,

$$
0.3-0.2=0.1 \mathrm{~N}
$$

(b) The weight of water displaced,
up thrust - weight of water displaced
Weight $=0.1 \mathrm{~N}$

# JSTIIL THTORI: ACBSE Coaching for 9(athematics and Science 

c) the volume of the marble,
d) the density of the marble,
e) the up thrust of alcohol on the marble,
(f) the density of alcohol.
(Ans: $1 \times 10^{-5} \mathrm{~m}^{3}$ )
(Ans: $3 \times 10^{3} \mathrm{kgm}^{-3}$ )
(Ans: 0.08 N )
(Ans: $800 \mathrm{kgm}^{-3}$ )
5. A fish of mass 1 kg and density $2000 \mathrm{kgm}-3$ is supported from a light spring of a spring balance. It is to be lowered into a tank of water placed over a compression balance. Before the fish in put into the water, the compression balance reads 60 N . When the fish is completely immersed in water, find
the upthrust acting on the fish,
the reading of the spring balance,
the thrust exerted on the bottom of the tank,
(Ans: 5N)
(Ans: 5N)
(Ans: 65N)
(Ans: 65N)
the reading of the compression balance.
6 A spring balance roads 178 N as a piece of copper if suspended. The copper is then totally immersed into a beaker of oil which originally weighs 240 N . (Density of copper and oil are 8900 and $900 \mathrm{kgm}^{-3}$.)

a) Find the new readings $W_{1}, W_{2}$ of the spring balance and the compression machine on which the beaker is put.
(Ans: $\mathrm{W}_{1}=160 \mathrm{~N}, \mathrm{~W}_{2}=258 \mathrm{~N}$ )
b) If the copper is put on the beaker so that the string becomes slack, what are the readings $W_{3}, W_{4}$ then?

Ans: $W_{3}=0, W_{4}=418 \mathrm{~N}$ )
A. 4 Law of the floating / floatation
(a) Introduction

Consider a body is completely immersed in a liquid and $\ell<\ell^{\prime}$.
$\ell=$ density of the liquid $\ell=$ density of the solid $\mathrm{W}=$ weight of the body in air

#  <br> ACBSE Coaching for 9(athematics and Science 

| W < upthrust F' | W <upthrust $\mathrm{F}^{\prime \prime}$ | W = upthrust F |
| :--- | :--- | :--- |
| < weight of liquid displaced | <weight of liquid displaced | = weight of liquid displaced |

a) Law

- Law of the floatation states that a floating body displaces its own weight of fluid in which it floats.
i.e. weight of floating body = weight of liquid displaced by the body
- Actually, law of floatation is a special case of Archimedes' Principle.
b) NOTE:
(i) Floating or Sinking
- A body (average density $\ell$ ) can float in a liquid (density $\ell^{\prime}$ ) if;
$\square$
$\ell<\ell^{\prime}$
e.g. a ship can float in water.

Average density < densityof water
of the ship
e.g. a balloon can move upwards in air.

> average density of balloon < density of air
$\Rightarrow$ upthrust $=$ weight of air displaced
> weight of the balloon
$\Rightarrow$ there is a lifting force acting on the balloon.
e.g. a submarine sinks by taking water into its buoyancy tanks so that its average density is increased.
(ii) Just Float

- A body (density $\ell$ ) is said to be just floating in a liquid (density $\ell$ )

$$
\begin{aligned}
& \text { if: } \quad \ell=\ell^{\prime} \\
& \text { e.g. }
\end{aligned}
$$

## 

 $A C B S E$ Coaching for 9 (athematics and Science(iii)Floating in two liquids

$$
\begin{aligned}
& W=F_{1}+F_{2} \\
& \mathrm{~W}=\text { weight of the body } \\
& \mathrm{F}_{1}=\text { weight of displaced liquid } 1 \\
& \mathrm{~F}_{2}=\text { weight of displaced liquid } 2
\end{aligned}
$$

(iv) Question

Can a man easily walk on water surface by fastening 2 pieces of wood under his feet ? ( mass of the man $=$ 50 kg )

Given: $\quad$ weight of the man $=500 \mathrm{~N}$ and density of water $=1000 \mathrm{kgm}^{-3}$
weight of the man = weight of water displaced (by law of floatation
$500=(\mathrm{lV}) \mathrm{g} \Rightarrow 500=(1000 \mathrm{~V}) 10$
volume of water displaced $\quad \mathrm{V}=0.05 \mathrm{~m} 3=50$ litres
It is obvious that only very large pieces of wood can displace such volume of water.

EXAMPLES: $\left(\right.$ Take $\left.=\mathrm{g}=\mathrm{ms}^{-2}\right)$ whenever necessary. $)$

1. A block of wood of volume of 0.1 m 3 and density of $700 \mathrm{kgm}^{-3}$ floats in water of density $1000 \mathrm{kgm}^{-3}$. Calculate
a) the weight of the block, (Ans: 700N)
b) the mass of water displaced by the block,(Ans: 70 kg )
c) the volume of the block immersed in water.(Ans: $0.07 \mathrm{~m}^{3}$ )
2.A cylinder is weighted with some lead shot so that it floats upright in water with 6 cm of its length under water. If the cylinders is floated in brine (salt water), what length of the rod is then below the surface? (Densities of water and brine are 1000 and $1200 \mathrm{kgm}^{-3}$ respectively.)

# THIDBML ACBSE Coaching for Ongathematics and Science 

(Ans: 5cm)
3. A balloon of volume $2000 \mathrm{~m}^{3}$ is filled with hot air of density $0.95 \mathrm{kgm}^{-3}$. If the total mass of the fabric, basket and pilot is 480 kg , calculate the lifting force on the balloon when the surrounding air has a density of $1.2 \mathrm{kgm}^{-3}$.
Upthrust $=$ weight of cold air displaced
Weight of hot air in the balloon = Weight of fabric, basket and pilot =Lifting force on the balloon $=200 \mathrm{~N}$
4.A cubical block of wood of side 0.5 m floats in water. Given that the densities of wood and water are 800 and $1000 \mathrm{kgm}^{-3}$ respectively, calculate
a) the weight of the block,
(Ans: 1000N)
b) the weight of water displaced by the block,
(Ans: 1000N)
c) the depth of the block immersed in water.
(Ans: 0.4m)
5. A wooden cube of side 1 m and density $800 \mathrm{kgm}^{-3}$ floats in water horizontally. (density of water $=1000 \mathrm{kgm}^{-3}$ )
a) Find the length of the vertical side which does not submerge.

(Ans: 0.2m)
b) If the cube is just totally submerged by placing a piece of $\operatorname{tin}$ (density $=7200 \mathrm{kgm}^{-3}$ ) on top of the cube, what is the weight of the tin?

(Ans: 2000N)
c) If the cube is just totally submerged by suspended the tin form its bottom, determine the weight of the tin required.

(Ans: 2320N)

# JSUNIL THIOB: ACBSE Coaching for 9(athematics and Science 

e.g. 6 A metal floats between some water and some water and some mercury. Find the ratio of the volume which are submerged in water to that in mercury, if the densities of the metal, mercury and water are 7900, 13600 and $1000 \mathrm{kgm}^{-3}$ respectively. (Ans: $\frac{19}{23}$ )

7. The fabric of a large balloon and its basket weigh 8000 N . The balloon is inflated with $2500 \mathrm{~m}^{3}$ of helium and moored in still air by a cable. If the temperature and pressure of the helium gas and air are standard, find the tension in the cable. If the cable is cut, find the acceleration with it rises.
(Densities of air and helium are 1.3 and $0.18 \mathrm{kgm}^{-3}$ respectively.)

e.g. 8 A wooden block is weighed in air, water, and liquid X , as shown below. Finally a lump of metal M with density $10000 \mathrm{kgm}^{-3}$ is attached to the wooden block and causes it to float in water.

Use this information to find:

the upthrust on the block in water. the volume of the block,
(Ans: 1000 N )
(Ans: $0.01 \mathrm{~m}^{3}$ )

# JSUINI जानロाix ACBSE Coaching for 9(athematics and Science 

the density of the block, the density of liquid X , and the mass of the metal lump M.
(Ans: $800 \mathrm{kgm}^{-3}$ )
(Ans: $750 \mathrm{kgm}^{-3}$ )
(Ans: 2kg)

## A. 5 Hydrometer

- A hydrometer is an instrument for determining the relative density of a liquid, basing on the law of floatation.
- It usually consists of a long graduated thin stem A, a large bulb B to provide buoyancy, and a small bulb C with some lead shots to enable the hydrometer to float upright.
- It should be noted that the readings of the graduations increase downwards and the graduations are not equally apart.
